

Glide Path Wizard

Your step-by-step guide to deploying a React/Vite app -- no guesswork required.

What is this?

Glide Path Wizard walks you through deploying your app in three clear steps. It's built for first-time deployers who want a checklist -- not a wall of docs. Just follow the steps, and you'll have your app live.

Step 1 -- Project Readiness

- * Confirm your app runs locally
- * List all required environment variables
- * Make sure .env is NOT committed to git

Step 2 -- Repository Setup

- * Enter your GitHub username + repo name
- * Choose whether git is already initialized
- * Run the generated commands in your project folder
- * Confirm your files appear on GitHub

Step 3 -- Deploy & Verify

- * Pick a host from the list below
- * Copy the build/output settings into the host dashboard
- * Add your environment variables in the host dashboard
- * Verify your URL, routes, env features, and one core user flow

Supported Hosts

Vercel | Netlify | Render | GitHub Pages | Cloudflare Pages | Railway
